ABSTRACT

The United States Training and Employment Service General Aptitude Test Battery (GATB), first published in 1947, has been included in a continuing program of research to validate the tests against success in many different occupations. The GATB consists of 12 tests which measure nine aptitudes: General Learning Ability: Verbal Aptitude: Numerical Aptitude: Spatial Aptitude: Form Perception; Clerical Perception; Motor Coordination; Finger Dexterity: and Manual Dexterity. The aptitude scores are standard scores with 100 as the average for the general working population, and a standard deviation of 20. Occupational norms are established in terms of minimum qualifying scores for each of the significant aptitude measures which, when combined, predict job performance. Cutting scores are set only for those aptitudes which aid in predicting the performance of the job duties of the experimental sample. The GATB norms described are appropriate only for jobs with content similar to that shown in the job description presented in this report. A description of the validation sample and a personnel evaluation form are also included. (AG)

FOREWORD

The United States Training and Employment Service General Aptitude Test Battery (GATB) was first published in 1947. Since that time the GATB has been included in a continuing program of research to validate the tests against success in many different occupations. Because of its extensive research base the GATB has come to be recognized as the best validated multiple aptitude test battery in existence for use in vocational guidance.

The GATB consists of 12 tests which measure 9 aptitudes: General Learning Ability, Verbal Aptitude, Numerical Aptitude, Spatial Aptitude, Form Perception, Clerical Perception, Motor Coordination, Finger Dexterity, and Manual Dexterity. The aptitude scores are standard scores with 100 as the average for the general working population, with a standard deviation of 20.

Occupational norms are established in terms of minimum qualifying scores for each of the significant aptitude measures which, in combination, predict job performance. For any given occupation, cutting scores are set only for those aptitudes which contribute to the prediction of performance of the job duties of the experimental sample. It is important to recognize that another job might have the same job title but the job content might not be similar. The GATB norms described in this report are appropriate for use only for jobs with content similar to that shown in the job description included in this report.

GATB Study #2770

DEVELOPMENT OF USIES APTITUDE TEST BATTERY

For

Molded-Goods Inspector-Trimmer (rubber goods) 759.687-042 S-443

This report describes research undertaken for the purpose of developing General Aptitude Test Battery (GATB) norms for the occupation of Molded-Goods Inspector-Trimmer (rubber goods) 759.687-042. The following norms were established:

| GATB Aptitudes | Minimum Acceptable GATB Scores |
|-------------------------|--------------------------------|
| Q - Clerical Perception | 90 |
| K - Motor Coordination | 85 |
| M - Manual Dexterity | 85 |

RESEARCH SUMMARY

Sample:

50 female workers employed as Molded-Goods Inspector-Trimmers or as Rubber-Goods Inspector-Trimmers (rubber goods) at the Goodyear Tire and Rubber Company plant located at St. Marys, Ohio. All individuals in this sample were non-minority group members.

Criterion:

Supervisory ratings.

Decign:

Longitudinal-test data were collected from December 12, 1956, through November 3, 1968, and criterion data were collected from November 26, 1968, through April 21, 1969.

Minimum aptitude requirements were determined on the basis of a job analysis, and statistical analyses of aptitude mean scores, standard deviations, and selective efficiencies.

Predictive Validity:

Phi Coefficient = .37 (P/2 <.005)

Effectiveness of Norms:

Only 68% of the non-test-selected workers used for this study were good workers; if the workers had been test-selected with the above norms, 79% would have been good workers. 32% of the non-test-selected workers used for this study were poor workers; if the workers had been test-selected with the above norms, only 21% would have been poor workers. The effectiveness of the norms is shown graphically in Table 1:

TABLE 1

Effectiveness of Norms

| | Without Tests | With Tests |
|--------------|---------------|------------|
| Good Workers | 68% | 7% |
| Poor Workers | 3 2% | 21% |

VALIDATION SAMPLE DESCRIPTION

Size:

N = 50

Occupational Status

Employed Workers

Work Setting:

Workers were employed at the Goodyear Tire and Rubber Company plant at St. Marys, Ohio.

Employer Selection Requirements:

Education: prefer high school graduates

Experience: no requirement

Tests: GATB and SRA nonverbal. A review of test data indicates

that S-17 cut off scores were not rigidly followed.

Other: Physical examination including back X-Ray, Interview,

Minimum height, 5'2" with proportionate weight.

Principal Activities:

The job duties for each worker are those shown in the job description on the Fact Sheet.

Minimum Experience:

No requirement. Entry level job.

TABLE 2

Means, Standard Deviations (SD), Ranges and Pearson Product-Moment Correlations with the Criterion (r) for Age, and Education.

| | Mean | SD | Range | r |
|-------------------|------|-----|-------|------|
| Age (years) | 37.7 | 9•3 | 22-62 | .058 |
| Education (years) | 11.1 | 1.6 | 8-16 | .118 |

EXPERIMENTAL TEST BATTERY

All twelve tests of the GATB B-1002, Form A, were administered to the validation sample during the period December 12, 1956, through November 3, 1968. This testing was done by the St. Marys' local office prior to referral to Goodyear.

CRITERION

The criterion data consisted of supervisor's ratings of job proficiency collected during the period November 26, 1968, through April 21, 1969. Rating Scale:

A special rating scale was developed for this study. The scale (see Appendix) included seven items of USTES Form SP-21, Descriptive Rating Scale, and five items developed to measure performance on specific aspects of the job identified by the supervisor as being important. The scale contained twelve items covering different aspects of job performance with five alternative levels of performance for each.

Reliability:

A reliability coefficient of .72 was obtained between the two ratings. In most cases the rating was done by two different raters. The final criterion consisted of the combined scores of the two ratings.

Criterion Score Distribution:

Possible Range:

24-120

Actual Range:

53-105

Mean:

83.2

Standard Deviation:

11.4

Criterion Dichotomy:

The criterion distribution was dichotomized into high and low groups by placing 32% of the sample in the low group and 68% into the high criterion group. Workers in the high criterion group were designated as "good workers" and those in the low criterion group as "poor workers". The criterion critical score is 80.

APTITUDES CONSIDERED FOR INCLUSION IN THE LORMS

Aptitudes were selected for tryout on the basis of a qualitative analysis of job duties involved and statistical analyses of test and criterion data. Aptitudes P, K, and M which do not have a high correlation with the criterion, were considered for inclusion in the norms because a qualitative analysis indicated that they were important to the job duties and the sample had a relatively high mean score on these aptitudes. With employed workers a relatively high mean score indicates that some sample preselection may have taken place. Although the correlation between aptitude Q and the criterion was not significant, it was decided to give the aptitude further consideration based on its high correlation. Tables 3, 4, and 5, show the results of the qualitative and statistical analyses.

TABLE 3

QUALITATIVE ANALYSIS

(Based on the job analysis, the aptitudes indicated appear to be important to the work performed.)

Aptitude

Rationale

P - Form Perception

Required to inspect diaphragms for cracks, tears, and other defects.

K - Motor Coordination

Required to handle items while using knife to trim excess; required to stretch diaphragm over template, rotating and inspecting at the same time. Performance indicates importance of eye and hand coordination.

M - Manual Dexterity

Required to trim molded rubber products by using "V" blade knife or scissors and then pack products into cartons.

TABLE 4

Moment Correlations with the Criterion (r) for the Aptitudes of the GATB

| Aptitude | Mean | SD | Range | r |
|------------------------------|-------|------|--------|------|
| G - General Learning Ability | 102.5 | 16,8 | 63-140 | .018 |
| V - Verbal Aptitude | 101.7 | 17.8 | 70-164 | 054 |
| N - Numerical Aptitude | 101,1 | 16.0 | 57-138 | .179 |
| S - Spatial Aptitude | 102.0 | 20.0 | 55-143 | .091 |
| P - Form Perception | 107.9 | 19.8 | 63-146 | 037 |
| Q - Clerical Perception | 106.4 | 15,6 | 74-139 | .253 |
| K - Motor Coordination | 107.3 | 16.8 | 66-148 | .090 |
| F - Finger Dexterity | 107.5 | 17.4 | 65-146 | ,010 |
| M - Manual Dexterity | 114.9 | 19.0 | 75–156 | .158 |

TABLE 5

SUMMARY OF QUALITATIVE AND QUANTITATIVE DATA

| Type of Evidence | | | | | | I | htit | udes | 3 |
|---|---|---|---|---|---|----|------|------|---------------|
| Job Analysis Data: | G | V | N | S | P | Q. | K | F | M |
| Important | | | | | x | | X | | X |
| Irrelevant Relatively High Mean | | | | | X | ٠. | X | χ . | х |
| Relatively Low Standard Deviation Significant Correlation | | | | | | | | | , |
| with Criterion | | | | | | | | | |
| Aptitudes to be Considered for Trial Norms | | | | | P | Q* | K | | М |

*Although not significant, this aptitude had the highest correlation with the criterion and a decision was made to include it for further consideration based on its high correlation.

DERIVATION AND VALIDITY OF NORMS

Final norms were derived on the basis of a comparison of the degree to which trial norms consisting of various combinations of P, Q, K, and M at trial cutting scores were able to differentiate between 68% of the sample considered good workers and 32% of the sample considered poor workers. Trial cutting scores at five point intervals approximately one standard deviation below the mean are tried because this Sill eliminate about one-third of the sample with three-aptitude norms. For two-aptitude trial norms, cutting

scores of slightly higher than one standard deviation below the mean will eliminate about one third of the sample. The Phi Coefficient was used as a basis for comparing trial norms. Morms of Q-90, K-85 and M-85 provided optimum differentiation for the occupation of Molded-Goods Inspector-Trimmer 759.687-042. The validity of these norms is shown in Table 6 and is indicated by a Phi Coefficient of .37 (statistically significant at the .005 level).

TABLE 6

Predictive Validity of Test Norms, Q-90, K-85, and M-85

| | | Monqualifying Test Scores | Qualifying Test Scores | Total |
|-------------------------------------|--------------------------------------|------------------------------|------------------------------------|-------|
| Good Workers | | 4 | 30 | 34 |
| Poor Workers | | 8 | 8 | 16 |
| Total | | 12 | 38 | 50 |
| Phi Coefficient Significance Lev | $(\emptyset) = .37$ $rel = P/2 < .6$ | 005 | Chi Square $(X_y^2) = \frac{1}{2}$ | 6.8 |

DETERMINATION OF OCCUPATIONAL APTITUDE PATTERN

The data for this study did not meet the requirements for incorporating the occupation studied into any of the 36 OAP's included in Section II of the Manual for the General Aptitude Test Battery. The data for this sample will be considered for future groupings of occupations in the development of new occupational aptitude patterns.

| | | -10- |
|----|--------------------|--|
| Α. | | th work can he get done? (Worker's ability to make efficient use of ne and to work at high speed.) |
| | i • | Capable of very low work output. Can perform only at an unsat- isfactory pace. |
| | 2 | Capable of low work output. Can perform at a slow pace. |
| | 3 | Capable of fair work output. Can perform at an acceptable but not fast pace. |
| | 4 | Capable of high work output. Can perform at a fast pace. |
| | 5 | Capable of very high work output. Can perform at an unusually fast pace. |
| в. | How goo work wh | d is the quality of his work? (Worker's ability to do high-grade ich meets quality standards.) |
| | 1 | Performance is inferior and almost never meets minimum quality standards. |
| | 2 | The grade of his work could stand improvement. Performance is usually acceptable but somewhat inferior in quality. |
| | 3 | Performance is acceptable but usually not superior in quality. |
| | 4 | Performance is usually superior in quality. |
| | 5 | Performance is almost always of the highest quality. |
| c. | How acc | urate is he in his work? (Worker's ability to avoid making mistakes.) |
| | 1 | Makes very many mistakes. Work needs constant checking. |
| | 2 | Makes frequent mistakes. Work needs more checking than is desirable. |
| | 3 | Makes mistakes occasionally. Work needs only normal checking. |
| | 4 | Makes few mistakes. Work seldom needs checking. |
| | 5 | Rarely makes a mistake. Work almost never needs checking. |
| D. | pies, e | h does he know about his job? (Worker's understanding of the princi- quipment, materials and methods that have to do directly or indi- with his work.) |
| | 1 | Has very limited knowledge. Does not know enough to do his job adequately. |
| | 2 | Has little knowledge. Knows enough to "get by." |
| | 3 | Has moderate amount of knowledge. Knows enough to do fair איכיי |
| | 4 | Has broad knowledge. Knows enough to do good work. |
| | 5 | Has complete knowledge. Knows his is thoroughly. |

| Ε, | | n aptitude or facility does he have for this kind of work? (Worker's as or knack for performing his job easily and well.) |
|----|---|---|
| | 1 | Has great difficulty doing his job. Not at all suited to this kind of work. |
| | 2 | Usually has some difficulty doing his job. Not too well suited to this kind of work. |
| | | Does his job without too much difficulty. Fairly well suited to this kind of work. |
| | 4 | Usually does his job without difficulty. Well suited to this kind of work. |
| | 5 | Does his job with great case. Exceptionally well suited for this kind of work. |
| F. | | ge a variety of job duties can he perform efficiently? (Worker's to handle several different operations in his work.) |
| | l | Cannot perform different operations adequately. |
| | 2 | Can perform a limited number of different operations efficiently. |
| | 3 | Can perform several different operations with reasonable efficiency |
| | 4 | Can perform many different operations efficiently. |
| | 5 | Can perform an unusually large variety of different operations efficiently. |
| G. | | I does he remember directions? (Worker's ability to remember worker and instructions.) |
| | I | Has very great difficulty remembering directions. Very often forgets. Must be continually reminded and corrected. |
| | 2 | Has considerable difficulty remembering directions. Often needs straightening out. |
| | | Can remember directions fairly $well$. Occasionally forgets or needs correcting. |
| | 4 | Has no difficulty remembering directions. Seldom forgets or needs correcting. |
| | 5 | Remembers directions exceptionally well. Almost never fergets or needs correcting. |

• (

- -12-H. How much attention does he pay to details? (Worker's ability and inclination to pay attention to small variations and differences or to specific procedures.) 1. ___ Pays almost no attention to details. Very often overlooks important details. 2. ___ Does not pay enough attention to details. Often misses important ones. 3. ___ Pays a fair amount of attention to details. Occasionally misses important ones. 4. ___ Pays considerable attention to details. Seldom overlooks important ones. 5. ___ Pays very close attention to details. Very seldom misses even the smallest detail. J. How well can this worker estimate the quality of an object? (Worker's ability to judge how good or how bad a piece of work is and to decide how much work is needed to bring it up to standard.) 1. ___ Is a very poor judge of quality. Cannot tell a good piece of work from a bad one. 2. ___ Has considerable difficulty telling whether a piece of work is adequate. Often makes incorrect judgements. 3. ___ Can usually tell whether a piece of work is adequate. Fair judge of quality. 4. ___ Has no difficulty estimating the quality of an object. Can identify bad products readily. Good judge of quality. 5. ___ Almost never makes an error in judging the quality of a piece of work. How well adapted is he for doing repetitive work? (Worker's ability to on the same operation or a very small number of tasks over and over again.) I. ___ Is not suited for doing repetitive work. Cannot adapt himself to doing the same job over and over again. 2. ___ Has considerable difficulty performing on a repetitive job. Poorly suited for doing repetitive work.
 - 5. ___ Is exceptionally well adapted for repetitive work. Can very readily repeat the same operation all day.

4. ___ Has no difficulty performing on a repetitive job. Well adapted

repetitive work.

for repetitive work.

3. ___ Can perform adequately on a repetitive job. Adapts fairly well to

| L. | How well adapted is he for inside work? (Worker's ability to work indoors.) |
|----|---|
| | Has very great difficulty working indoors. Not adapted for inside work. Definitely does not like working inside. |
| | 2 Has considerable difficulty working indoors. Somewhat dislikes inside work. |
| | 3 Can work fairly well inside. Is satisfied working indoors. |
| | 4 Performs well indoors. Likes working inside. |
| | 5 Works best indoors. Definitely prefers inside work. |
| Μ. | Considering all the factors already rated, and only these factors, how acceptable is his work? (Worker's "all-around ability" to do his job.) |
| | Would be better off without him. Performance usually not acceptable. |
| | 2 Of limited value to the organization. Performance somewhat inferior. |
| | 3 A fairly proficient worker. Performance generally acceptable. |
| | 4 A valuable worker. Performance is usually superior. |
| | 5 An unusually competnet worker. Performance almost always top notch. |

S-443

FACT SHEET

Job Title: Molded-Goods Inspector-Trimmer (rubber goods) 759.687-042

Job Summary: Performs several miscellaneous trimming as well as meticulous inspecting functions, by **Peeling** rind, trimming with scissors, stretching over jig then soap stoning prior to boxing for shipment to customer. Worker may also trim molded rubber products, using "V" Blade, straight bladed knife, and scissors, to affect smooth close trim of rubber flash, inspecting for defects, that product might be packed for shipment, or returned for repairs.

Work Performed: Specific duties and items being trimmed and inspected may differ for some workers. Some workers pick up diaphragm while standing at bin. Pull rind from diaphragm and toss to end of bin, while tossing diaphragm to workbench to an accumulated quantity of approximately seventy. Walk several steps to workbench, and sit on high-backed stool. Start inspection / trim operation comprising 7 to 30 seconds per unit, according to the condition of the perimeter after rind is peeled off. Pick up one diaphragm and place over template. Rotate, making inspection and flexing rubber at 1. D. and perimeter. Inspect for cracks, tears, and other visual defects. Discard imperfect units in salvage bin on floor. Use scissors to trim excess rind which did not peel off in first operation. Place in cardboard box to left of work area, to a quantity of approximately 40 pieces.

Then put on canvas gloves. Shake talc or soap stone, over accumulated quantity of trimmed, imspected diaphragms in box. Rub <u>each</u> diaphragm evenly distributing talc to prevent sticking together. May find defect after powder is applied which was not visible before, and discard piece in salvage bin. Stack talced diaphragms on left hand, placing newly inspected diaphragm on top, and rotate to distribute talc, to a quantity of ten. Nests twenty diaphragms over previously formed cardboard stapled rings in a compartment of shipping carton, totaling 360 then lid the carton that an additional 360 units can be added for a total shipment of 720 per carton. May be required to make up rings by stapling with regular heavy duty stapling machine.

Some workers pick up Deck Chutes from bin, to working quantity of approximately twenty-five, placing same with large opening down, on workbench. Pick up "V" knife in right hand, and grasp Deck Chute top with left hand. Trim rubber flash from outside diameter of chute (perimeter of large end.) Inspect for defects, including cracks, blisters and discoloration while rotating piece. Continue use of "V" knife and trim flash from flange, and stack trimmed chutes on bench approximately four high.

Next pull high chair to adjacent bench/carton work position. Pick up one piece, holding on lap while sitting on chair. Use straight pointed knife to skewer flash from three holes in flange. Complete trim of rind from I. D. of chute, inspecting interior as well as exterior by rotation in hand. Place trimmed, inspected chute in carton, 12 units to each layer, with divider, 36 chutes per carton. Place defective, but repairable chutes, in separate bin for return to proper department for repairs. Throw scrap into salvage bins. Make out Inspection Tag, and place in bin, before it is removed by Material Handler.

16

Effectiveness of Norms: Only 68% of the non-test-selected workers used for this study were good workers; if the workers had been test-selected with the S-443 norms, 79% would have been good workers. 32% of the non-test-selected workers used for this study were poor workers; if the workers had been test-selected with the S-443 norms, only 21% would have been poor workers.

Applicability of S-443 Norms: The aptitude test battery is applicable to jobs which embody a majority of the duties described above.

17
